

Installation and Maintenance Instructions

Apinox Product Code 305 Wash Trough

Installation

To install the washtrough offer the unit to the wall at the desired height and, after ensuring that the unit is level, carefully mark the position of the screw holes in the rear upstand and the screw holes in the integral wall brackets (underneath). Remove the trough, drill and plug the holes and secure the trough firmly to the wall using suitable (non corroding) fasteners, compatible with the structure of the wall.

Note:

If optional front support legs have been supplied these should be attached to the fixing studs provided before offering the wash trough to the wall. The leg(s) should be vertical and the foot in each support leg should be adjusted to the floor before, drilling, plugging and screwing into position.

Fit any taps as required into the tap holes provided.

Fit the waste to the trough, and make all plumbing connections

Earthing Continuity

All basins are provided with a number of fixing points on to which an earthing continuity wire with an end terminal can be secured.

Maintenance

Routine cleaning is necessary to maintain the appearance of stainless steel. Washing with soap or a mild detergent and warm water, applied with a sponge or bristle brush, followed by a clear water rinse is all that is required.

For further information please see our 'Care and Maintenance of Stainless Steel' leaflet.
