

Installation Instructions

The soap dispenser requires a 25mm diameter hole in the countertop positioned so that the spout (A) swivels to direct the soap outlet over the bowl or sink.

An adjustable threaded shank (B) allows for installation in countertops up to 102mm thick.

The dispenser is supplied with a tool to remove the escutcheon (C) after installation to allow easy refilling from the top (please do not lose the tool).

Unscrew the escutcheon (C) from the shank (B) and fix the clear plastic tube (D) to the underside nozzle and then refit the escutcheon to the shank.

Thread the rubber washer (E) on to the shank first (this forms a seal on top of the deck surface).

Mount the assembly to the deck and thread the large steel washer (F) and the back nut (G) from the underside and tighten "finger-tight" only.

Mount the larger back nut (H) to the shank.

Fix the adaptor fitting (I) to the reservoir bottle (J) and screw the assembly on to the end of the shank (B). The larger back nut (H) is then tightened to the bottle to lock it securely to the shank. The bottle should not require removal if normal filling procedure is from the top with access gained by use of the supplied tool.

Complete the assembly by removing the escutcheon. Fill with a suitable liquid soap and remount the escutcheon tightening with the supplied tool but taking care not to overtighten
